

MAYTONI

Moments of the light cycle

Technical 2023

Annual light guide

We at Maytoni know that behind every light there are dozens of passionate people – engineers, designers, architects, managers, factory and warehouse employees, as well as their families and friends.

This catalog is dedicated to all those who fill every moment with light. After all, the moments of light circle become important only when people turn on the light inside.

Thanks to their courage, perseverance, attention to detail and love for light, every moment of the present becomes special. To turn the light on, you need someone who wants it to become lighter.

Accurate to the beam

In order to prevent distortion of perception, it is necessary to control many technical parameters that can be measured and digitized by high-precision and compound devices. The results of this control are always noticeable and visible to the eye, but difficult to describe.

The technical department studies each lamp model and controls its quality at all stages of production. Technicians work in a 270 m² laboratory, surrounded by a dozen compound mechanisms: a goniophotometer, a viewing oscilloscope, an integrating sphere, and many others.

Each of them performs its "duties": calculates the exact intensity of the light flux, light temperature, light scattering density and the exact shape of the beam - photometry of the lamp, evaluates the stability of the controllers and the technical parameters of the LEDs. Each indicator recorded by devices is a step towards the highest quality lighting.

How will the lamp work at different dayparts? How will light be dispersed in space?

This can be done either by using accurate measurements and special lighting design software, or by using an intuitive approach to lighting and the correct specifications.

Lighting science

For their correct interpretation, it is always necessary to take into account the features of the space where the light source will be located.

Light, making visible objects, outlines and shades, remains unperceivable, intangible. This is electromagnetic radiation in a certain range of wavelengths that is reflected from surrounding objects.

All artificial light sources have their own values of the light flux, their own shape of the photometric body, light intensity, their own distribution of radiation over the spectrum.

The main characteristics of light, which are important for our perception and visual comfort, appear exactly where the light faces the objects around us.

Brightness
Unit: cd/m^2

The amount of light emitted from a unit of visible surface in a given direction.

Light flux
Unit: Lumen (lm)

The amount of light emitted by the source.

Luminous intensity
Unit: candela (cd)

The amount of light emitted in a given direction.

Illumination
Unit: lux (lx)

The amount of light impinging on a surface.

Effective power

How many square meters will the lamp cover? The answer lies in the light flux other than intensity.

The intensity of the lamp or lamps does not help us much in understanding whether there is enough light. The intensity of the light source can be useful to us mainly for performing the electrical part of the lighting installation and evaluating the energy efficiency of the lamp. The best modern lamps have a luminous efficacy approaching 200 lm/W.

The major indicator that worth paying attention to is the light flux, which is generated by a light source – a lamp or a built-in LED source. It is measured in lumens. This indicator gives us the opportunity to understand how much light will additionally appear in the interior with turning on a lamp. For example: a typical incandescent lamp with a power of 100 W creates a light flux equal to approximately 1300 lm.

A typical 100W incandescent lamp produces a light flux of approximately 1300 lm.

Is this light enough?

Illumination is not given by the lamp, but by that part of its light flux that hit the surface concerned.

Illumination is a characteristic of the illuminated surface rather than the lamp. The amount of light that reaches the surface depends on the distance to this surface, the spatial orientation of the lamp, the presence of objects that reflect or absorb light.

In addition to the characteristics of the light source, illumination also depends on the geometry and reflective characteristics of objects surrounding a given surface, as well as on the relative position of the lamp and the given surface. Illumination is equal to the ratio of the light flux that impinges on the surface to the area of this surface.

The unit of measure for illuminance is 1 lux (lx).
 $1 \text{ lux} = 1 \text{ lm/m}^2$.

Color temperature

Designers recommend using lamps of different color temperatures for different zones in the interior.

This concept is based on a physical phenomenon in which an absolutely black body, heated to a certain temperature, begins to emit light of a certain color – from rich red to pristine white and blue. In our natural environment, we are constantly confronted with changes in the color temperature of sunlight throughout the day, which has an impact on our well-being. When choosing artificial light sources, you need to know what temperature corresponds to a particular shade. The choice of the color temperature of light sources is determined primarily by the color scheme of the illuminated objects: cold colors look better in cold (neutral) light, warm colors look better in warm light.

Symbols for color temperature

**2700–3000K
Very warm white**

Cozy evening atmosphere in the bedroom, living room. Dining table lighting. Floor lamps, wall lamps, bed lamps.

**3000–4000K
Warm white**

Comfortable and relaxing light for living rooms. Most often, this temperature is used in the lamps of chandeliers and wall lamps.

**4000–5000K
Neutral white**

Daylight for living rooms, kitchens, workplaces in offices, reading nooks, shops, museums. Suitable for ceiling and pendant lamps.

**5000–6000K
Cold white**

This color temperature is not used in residential areas. Most often used in technical rooms.

CRI index

Different types of lamps and fixtures can render colors differently, even if they have the same color temperature.

Color rendering depends on the completeness of the spectral composition of the radiation – a set of electromagnetic waves with different lengths and colors. The extent of rendering is measured using the color rendering index – CRI (Color Rendering Index). The reference light source is considered to be sunlight. Its color rendering index is 100. Thus, the higher the CRI of the lamp, the less the shades of objects deviate from their color in natural sunlight.

The temperature of light, determined by the spectral composition of radiation – the presence of certain wavelengths in it – can affect a person's well-being in different ways.

Warm light

Warm shades are best used in the evening hours, as they promote relaxation, soothe and help create a cozy atmosphere.

Neutral light

Lamps with neutral white light, which is most similar to sunlight at noon, are ideal for rooms in which they spend a lot of time, work for a long time.

Cold light

Cold light with a bluish tint significantly activates the human psyche, stimulates the nervous system. It is not recommended to use such light for a long time, since a short-term stimulating effect is followed by the opposite effect - slowdown, drowsiness, apathy.

Symbolic designation of an increased level of CRI

The value of the color rendering index determines how advantageous this or that shade will look in the interior.

High index
CRI

Average index
CRI

Low index
CRI

Color in the light

By making a mistake when choosing the color temperature of the lamps, you can significantly change the color perception of the interior.

The unpublicized rule of high-quality lighting design is to maintain the same color temperature within the same room or within the same zone. It is also important to consider the interaction of color temperature with the shades that are used in the interior.

Red color

Can be softened with warm orange light (2500-3000 K).

Orange color

(Intense) turns soft and pastel with a warm yellowish glow (3000K).

Yellow

Will become gray and inexpressive if lamps with a bluish tint (5000-6500 K) are used.

Green color

Can be softened to light green with warm orange light (2500-3000 K) or tinted with aquamarine using bright bluish light (4000 K).

Blue colour

Light sources of a neutral white shade (4000 K) can render most adequately.

Purple

With a yellowish tint of lighting will turn into red, so it is illuminated with high color temperatures (4000-5000 K).

Scattering angles

To describe the photometric body of a light fixture, lighting designers use photometric files. They allow you to simulate the distribution of light in a lighting scene using specialized programs. However, to work with light at a basic level, it is enough to understand one key parameter – the light scattering angle.

Scattering angle symbols

Directional luminaires

Omnidirectional luminaires

You can see photometric data at mayton.de

F – Flood (360 degrees)

Illumination of all planes of space without a strict direction to create a general illumination.

**SS – Super Spot
(0-15 degrees)**

Extra-narrow beam of light for bright, minimalist accents and highlights.

**S – Spot
(15-30 degrees)**

Narrow beam of light for directional illumination of interior objects and furniture.

**M – Medium
(30-50 degrees)**

A beam of light of medium width for local illumination of spaces and furniture, as well as for creating general lighting in a group with other luminaires.

**W – Wide
(50-80 degrees)**

Wide beam angle for general lighting in compact spaces.

**WW – Wash Wide
(больше 80 degrees)**

Extra-wide angle of light to create a flood effect that evenly illuminates surfaces in a space.

Comfort for your eyes

To create a comfortable light environment, it is necessary to take into account the quality of light, in particular, its glare effect. The glare effect of light is evaluated using a Unified Glare Rating – UGR (Unified Glare Rating).

The lower it is, the more comfortable the light environment is in terms of glare. For most rooms, a UGR value < 19 is sufficient

To reduce glare effect and reduce UGR, the following engineering solutions are used:

Hidden light source and optics

Lamps with a hidden light source and optics.

FOCUS LED Series

Acrylic diffusers

Lamps with high quality acrylic diffuser to reduce glare.

BASIS Series

Reduced level
UGR symbol

Maytoni luminaires are specifically tested and engineered to reduce glare and reduce visual discomfort.

Recessed light source.

Luminaires with recessed light source. This eliminates direct and reflected glare and also creates protection against glare.

YIN Series

Wide scattering angle.

Diffused lighting luminaires are equipped with lenses. They clearly limit the scattering angle and soften aggressive light, making it comfortable and uniform. In this case, high-quality lenses with the highest possible light transmission are used, and the LED must have maximum brightness. Poor quality plastic lenses poorly deal with reducing glare and absorb up to 60% of the diode light flux.

ALFA Series

Anti-glare accessories.

Use of various anti-glare accessories. For example, Honeycomb and non-reflective glasses.

FOCUS LED Series

Functional lighting design

Applying a functional approach to lighting planning.

Orlo Series

Degree of protection IP

All luminaires can be divided according to operating conditions into three main groups: for interiors, for open spaces and for extreme environments (saunas, laboratories, explosive atmospheres, etc.).

This division is based on the protection of lamps in two main areas - from moisture and from dust. The degree of protection is described using the IP - Ingress Progression Rating system. The first number indicates the degree of protection against dust, the second - against moisture. The higher the rating, the higher the level of protection.

IP symbols

Types of luminaires according to the degree of IP protection:

IP 20

Indoor rooms (dry rooms without aggressive conditions).

IP 44

Wet rooms
(WC facilities, shower cabins).

IP 54

Indoor rooms (bathrooms, shower cabins), outdoor premises under a canopy.

IP 65

Indoor rooms (bathrooms, shower cabins), street, outdoor premises.

IP 68

Possibility of immersion in water (pools, fountains).

The Maytoni range includes luminaires for all types of spaces.

Be sure to pay attention to the IP marking of the luminaire, especially when choosing lamps for bathrooms, kitchens and rooms with access to open air (loggias, balconies).

One-touch light

The most popular light control protocols are Wi-Fi, Bluetooth and Zigbee, each of which is most effective depending on the required range of use.

Light control protocols differ from each other like foreign languages – lamps operating within the same protocol interact perfectly with each other, but lamps operating on different protocols can only be combined together using auxiliary devices and systems. Some of the most popular smart ecosystems are Dali and Tuya.

SYSTEMS

Lamps
and accessories

Track systems

Any track system consists of connecting components, tracks and lamps that are attached to them. The main advantage over other lighting solutions is that each lamp can be freely moved along the track.

Track systems are a modern way to solve interior lighting problems, which has come into everyday life from large industrial facilities. Tracks are highly functional and allow you to create multi-level lighting, which can be easily adapted to any task and need in the future.

Each lamp is easily fixed and connected to a power source at any arbitrary point on the track. Track lighting is completed and mounted according to the principle of a modular constructor. You can simultaneously fix lamps of both directional and diffused light on one track, as well as combine them into groups at the installation stage. This allows you to create lighting scenarios as accurately and efficiently as possible that meet the characteristics of the interior and the rhythm of the life of the people inside it.

Track lighting systems are not suitable for rooms with high humidity due to the presence of exposed conductive elements.

Key advantages of track systems

1. Easy-to install even in rooms with complex engineering communications.
2. Compactness of the light system, regardless of the area of space.
3. High energy efficiency of lighting solution.
4. Free variability and adjustability of the track contours of the system.
5. Large selection and easy interchangeability of lamps in the tracks

S35 Track System Components

Track types

There are many track standards, but the most common are single-phase, three-phase and low-voltage magnetic tracks, which are used in Maytoni.

In single-phase tracks, 2 current-carrying conductors are laid: phase and neutral, and in three-phase tracks - 4 current-carrying conductors: 3 phases and neutral. These types of tracks differ from each other in that one independent group of lamps can be mounted on the first ones, and up to 3 groups can be placed on the second ones at the same time, each of which will be controlled from its own switch (or keys on the general switch).

Single- phase track

Three -phase track

Maytoni track systems are based on two types of track mounts: mechanical and magnetic.

In mechanical tracks, lamps are attached using adapters. They physically press the lamps down to the inner part of the track using the springs. In magnetic tracks, lamps are attached by magnets.

Mechanical fastening of the lamp in the track

Magnetic fastening of the lamp in the track

Types of track mounting

You can choose the type of mounting in one track system that best of all suits the design of the room. The combination of different types of mounting allows the use of lamps from the same series on different types of surfaces.

Examples of Exility Magnetic System
Mounting options

Various mounting options are available, which are suitable for different initial interior coatings and structures.

Surface

The track is mounted directly on a flat surface of the ceiling or wall using self-tapping screws.

Pendant

Modification of the removable track which is fixed to the ceiling on special cables.

Built-in under a stretch ceiling

Modification of the track installation using a special profile that allows you to make the hidden installation of the track in a stretch ceiling.

Built-in under drywall

The track is built into the plasterboard ceiling, making it less visible and practically does not protrude beyond the ceiling surface.

Unity

Single-phase track system

Basic system for unified lighting scenarios.

The minimum allowable distance between lamps on the track is 25 cm.

TR044-1-12W3K-W

Light source with opal diffuser for anti-glare effect.

Adjustment of the direction of the light flux 360° in the horizontal plane and 90° in the vertical plane.

Points

^{EN} Metal body. Recessed LED light source. Low glare level (UGR<15) and Highcolor rendering index. Swivel mechanism.

^{DE} Metallrahmen. Versenkte LED-Lichtquelle. Niedrige Blendwirkung (UGR<15) und hoher Farbwiedergabeindex. Schwenkvorrichtung.

^{IT} Corpo in metallo. Sorgente luminosa LED da incasso. Abbagliamento ridotto (UGR<15) e indice di resa cromatica elevato. Meccanismo girevole.

^{FR} Corps métallique. Source de lumière LED encastrée. Faible taux d'éblouissement (UGR< 15) et fort indice de rendu de couleur. Mécanisme pivotant.

ANTI-DAZZLE FILTERS

ARTICLE	DIAMETER
HONEYCOMB-D31	33 MM
HONEYCOMB-D38	42 MM
HONEYCOMB-D50	53 MM

To install a new lens in the FOCUS LED luminaire, unscrew the trim, replace the lens with a new one and screw the trim ring back.

To install an anti-glare filter in a FOCUS LED luminaire, unscrew the trim, install a light filter into it and screw the trim ring back.

Focus LED

^{EN} Metal body. The LED light source is recessed into the body. Low glare level (UGR<15) and Highcolor rendering index.

^{DE} Metallrahmen. Die im Rahmen versenkte LED-Lichquelle. Niedrige Blendwirkung (UGR<15) und hoher Farbwiedergabeindex.

^{IT} Corpo in metallo. La sorgente luminosa a LED è incassata nel corpo. Abbagliamento ridotto (UGR<15) e indice di resa cromatica elevato.

^{FR} Corps métallique. Source de lumière LED encastrée dans le corps. Faible niveau d'éblouissement (UGR <15) et fort indice de rendu de couleur.

LIGHTS

Lamps
and accessories

Spotlights

Downlights are recessed fixtures that are used to create directional lighting. In houses and apartments, they are most often used as additional light sources that are part of a multi-level lighting system.

The literal translation means “shining down”. Downlights are equipped with special reflectors responsible for the direction of the light flux. They are used to illuminate functional areas, visual space zoning, decorative lighting and other purposes. Due to their compact size and low weight, downlights are ideal for installation in plasterboard, pendant and stretch ceilings.

Lamps under putty

In addition to electrical installation work, installation also involves painting work and allows you to mount products flush with the surface without seams and joints.

Spring-based lamps

Suitable for installation in all types of ceilings. To use this type of mount in stretch ceilings, a special mount is required to prevent overheating of the lamp, which is purchased separately along with the main ceiling mounts.

Lamps for compact mounting

These luminaires are a type of spring-based lamps that require less than 2 centimeters of ceiling space for installation.

CEILING

A large, bold, blue 'L' character is positioned on the right side of the page, partially overlapping the 'CEILING' text. Several thin, curved blue lines sweep across the page, starting from the left and ending on the right, creating a sense of movement and design.

Present
illuminated

The page features several decorative blue elements: a large, thin, horizontal oval shape at the top; a large, bold, blue letter 'G' on the left side; and several thin, curved blue lines that sweep across the page, some overlapping the 'G' and the main title.

Supersymmetry

Fusion of light

red**dot** award

One of the most elegant and romantic concepts of modern quantum physics is the concept of supersymmetry. It describes the relationship between two main classes of elementary particles that are capable of evolving one into the other and uniting into superpartners. This is very similar to how we switch between personal and private life, one or another need for the light around us, during our day. The simplicity of changing elementary particles inspired us to create a lamp that would also allow changing the light picture of reality - elementarily, with one movement.

The transformation is carried out with a simple movement that allows you to turn it from a general vertical source of soft diffused light into a horizontal one. And now this is a technological source of directional functional light for work, creativity and close communication. The kinetic effect of the magnetic connection of symmetrical parts allows you to approach the change in space and feel it with your own hands.

Carefully engineered design with magnetic elements and a cable attachment system ensures a stable level of attachment height in both horizontal and vertical configurations. During prototyping and development, the luminaire concept received all major international design awards: Red Dot Awards - Design Concept, LIT lighting design Awards, IF Awards, A'design Awards, Good Design Awards, IDA Awards, EPDA Awards, Muse Design Awards, LICC Awards, SIT Awards, ADD Awards.
